

Type to Learn 4 v1.2 Update Installation Instructions

You must be logged in as an Administrator before running the update. Download times vary greatly, but depending on your connection speed it may take several minutes to download.

CLIENT installation – All Users (Web, Network, and Standalone)

This v1.2 update needs to be installed on every client machine (Mac and Win) running Type to Learn 4, including home computers running the Web version. It is critical that Type to Learn 4 v1.0 or v1.1 is already installed on these machines before running the v1.2 update patch. You must run this installer on every client machine.

Macintosh Client Steps:

1. Download the update file to the Mac desktop from www.ttl4.com/downloads.
2. Unarchive the file.
3. Run the TTL4 Update MAC MPKG application.
4. Enter your administrator username and password if asked.
5. Click Continue.
6. Read the License Agreement and click Continue/Agree.
7. Select the destination where you **already** have Type to Learn 4 installed. Click Continue.
8. Keep the default Easy Install selection and click Install.
9. The installer will search for installed components. Please wait. The updated files will install.
10. Click Quit when the installation is complete.

Windows Client Steps:

1. Download the update file from www.ttl4.com/downloads.
2. Unzip the file and double-click to launch the TTL4 1.2 Update installer.
3. Click Next.
4. Read the License Agreement and click Agree.
5. The installer will search for installed components. Please wait.
6. The updated files will install.
7. Click Close when setup is complete.

Important! Users who authenticate through a Proxy Server: If you use a proxy server to connect to the internet, you will need to **reset** your proxy settings for Type to Learn 4 after running the 1.2 client update. Launch the “Type to Learn 4 Proxy Settings” application from the same directory where Type to Learn 4 resides on your client machine (on Windows: C:\Program Files\Sunburst\Type to Learn 4, and on Macintosh: Applications/Sunburst/Type to Learn 4 are the defaults). Use this application to configure your *Type to Learn 4* proxy settings. Turn on/off using a proxy server with *Type to Learn 4*, specify the address and port of your proxy, and if your proxy server requires a username and password those can be set here.

The Proxy Settings application saves your information in a file called "ProxySettings.ini" in the same directory. Copy this ProxySettings.ini file to every client machine that needs to run *Type to Learn 4*, replacing the original ProxySettings file. Be sure to place it in the same folder as the *Type to Learn 4* application: (on Windows: C:\Program Files\Sunburst\Type to Learn 4, and on Macintosh: Applications/Sunburst/Type to Learn 4 are the defaults) on every machine.

SERVER installation – Network Version Only

Note: Both Macintosh and Windows server installations require a restart of your server.

Note: The v1.2 update adjusts the database, so any backups you may have previously made will no longer work. The patch automatically backs up your existing database before making changes.

Important: For both Mac and Windows, this v1.2 server patch must be installed on your school server that is already running Type to Learn 4 v1.1. **It is critical that the Type to Learn 4 v1.1 server components are already installed on your server before running the v1.2 update patch.** If you are not sure what server version you are running, open a web browser on your server and go to: <http://your.server.ip.address:3000>. The Type to Learn 4 welcome page will appear and the version number will be displayed. If it says v1.1 you may continue with the v1.2 update. If it says v1.0 you must first run the v1.1 server update before updating to v1.2. The v1.1 server updates for Macintosh and Windows are available for download on <http://ttl4.sunburst.com/downloads>.

Macintosh Server Steps for v1.2:

1. Download and unarchive the update file.
2. Inside the Mac TTL4 Patchers 1.2 folder there are 2 different server updates for Macintosh, one for PPC (TTL4 MacOS X PPC Patch 1_2 Server Distribution Package.mpkg) and one for Intel (TTL4 MacOS X X86 Patch 1_2 Server Distribution Package.mpkg). **Be sure to launch the correct installer for your server system.**
3. Click Continue.
4. Select an install location on your server and click Continue.
5. Click Upgrade.
6. Enter your Administrator username and password, if asked.
7. Click Continue Installation.
8. Click Restart once installation is complete.

Note: This Mac v1.2 server update installs to a separate location from the v1.1 server components and does not overwrite the v1.1 files. This is intentional and necessary. The two versions will coexist on your server, while the client application is using v1.2.

Windows Server Steps for v1.2:

1. Download and unzip the update file.
2. Double-click the TTL4WindowsServerPatch11to12.exe to launch the installer.
3. Click Next.
4. Click Install.
5. Click Finish.
6. Restart your server.
